Outline of Contents

Introduction

Constraints of w_{de} from Present Data

Constraints of w_{de} from Future Data

- effects of the divided position of bins

- effects of the number of supernovae data

- effects of the error in the distance modulus

In higher redshift bins, errors of w_{de} from observational data are much larger

N. Suzuki, D. Rubin, *et al.*, *Astrophys. J.* **746**, 85 (2012)
[arXiv:1105.3470 [astro-ph.CO]].

Main reasons:

- ▶ There are less related data points at higher redshift.

$z \rightarrow$	0.2	0.4	0.6	0.8	1.0	1.2	1.4
N_{bin}	173	77	71	78	60	8	5

Table: the redshift distribution of 472 supernovae data from 3 years Supernova Legacy Survey (SNLS3).

Main reasons:

- ▶ There are less related data points at higher redshift.

$z \rightarrow$	0.2	0.4	0.6	0.8	1.0	1.2	1.4
N_{bin}	173	77	71	78	60	8	5

Table: the redshift distribution of 472 supernovae data from 3 years Supernova Legacy Survey (SNLS3).

- ▶ In higher redshift bins, the role played by DE in the luminosity distance

$$D_I(z) = (1+z) \int_0^z dx/H(x) \quad (1)$$

is weaker, since $\Omega_{de} = \rho_{de}/3H^2$ will be smaller.

Methology:

- ▶ Divide the redshift region under consideration into 2 bins,

$$w_{de}(z) = \begin{cases} w_1, & 0 \leq z \leq z_1 \\ w_2, & z_1 < z \leq 1.4 \end{cases}, \quad (2)$$

where w_1 and w_2 are constant.

Methology:

- ▶ Divide the redshift region under consideration into 2 bins,

$$w_{de}(z) = \begin{cases} w_1, & 0 \leq z \leq z_1 \\ w_2, & z_1 < z \leq 1.4 \end{cases}, \quad (2)$$

where w_1 and w_2 are constant.

- ▶ Errors of w_{de} in the second bin indicate the limitations in determining w_{de} at high redshift (beyond $z = z_1$).

Observational data adopted:

- ▶ 472 supernova from SNLS3 with systematic errors.

Observational data adopted:

- ▶ 472 supernova from SNLS3 with systematic errors.
- ▶ BAO Distance Parameter A

$$A = H_0 \Omega_{m0}^{1/2} H^{-1/3} (0.35) \left(\frac{1}{0.35} \int_0^{0.35} \frac{dz}{H(z)} \right)^{2/3}$$

Observational data adopted:

- ▶ 472 supernova from SNLS3 with systematic errors.
- ▶ BAO Distance Parameter A

$$A = H_0 \Omega_{m0}^{1/2} H^{-1/3} (0.35) \left(\frac{1}{0.35} \int_0^{0.35} \frac{dz}{H(z)} \right)^{2/3}$$

- ▶ 12 Observational Hubble Data with $z < 1.4$.

z	0	0.1	0.17	0.27	0.4	0.48	0.88	0.9	1.3	0.24	0.34	0.43
h	0.738	0.69	0.83	0.77	0.95	0.97	0.9	1.17	1.68	0.7969	0.838	0.8645
σ_h	0.024	0.12	0.08	0.14	0.17	0.6	0.4	0.23	0.17	0.0232	0.0296	0.0327

Results

Figure of merit can be used to compare the goodness of constraints of w_{de} at high redshift

$$\text{FoM} = [\det C(w_1, w_2)]^{-1/2},$$

where $C(w_0, w_1)$ is the covariance matrix of w_1 and w_2 .

z_1	Ω_{m0}	w_1	w_2	χ^2_{min}	FoM
0.30	0.279 ^{+0.023+0.047} -0.020-0.040	-1.05 ^{+0.09+0.19} -0.10-0.21	-1.44 ^{+0.42+0.74} -0.54-1.19	423.988	19.346
0.35	0.277 ^{+0.031+0.055} -0.016-0.038	-1.08 ^{+0.09+0.19} -0.09-0.19	-1.52 ^{+0.62+1.01} -0.87-2.39	424.323	11.525
0.40	0.272 ^{+0.042+0.067} -0.010-0.033	-1.11 ^{+0.11+0.21} -0.07-0.17	-1.31 ^{+0.78+1.12} -2.35-7.87	424.614	4.115
0.45	0.269 ^{+0.045+0.067} -0.006-0.029	-1.09 ^{+0.07+0.16} -0.12-0.21	-0.92 ^{+0.79+0.90} -6.80-19.07	424.764	1.981

Table: The best-fitted values and their 68.3% and 95.4% C.L. errors from present observational data.

At high redshift, the likelihood of w_{de} is flat on its downward side.

The simulated 2298 supernovae data

- ▶ 1998 SN data with $z \in [0.1, 1.7]$ from a SNAP-like JDEM survey

The simulated 2298 supernovae data

- ▶ 1998 SN data with $z \in [0.1, 1.7]$ from a SNAP-like JDEM survey
- ▶ 300 SN data with $z < 0.1$ from the NSNF.

The simulated 2298 supernovae data

- ▶ 1998 SN data with $z \in [0.1, 1.7]$ from a SNAP-like JDEM survey
- ▶ 300 SN data with $z < 0.1$ from the NSNF.

The simulated 2298 supernovae data

- ▶ 1998 SN data with $z \in [0.1, 1.7]$ from a SNAP-like JDEM survey
- ▶ 300 SN data with $z < 0.1$ from the NSNF.

- ▶ The fiducial model: $w_{de}(z) = -1$

The simulated 2298 supernovae data

- ▶ 1998 SN data with $z \in [0.1, 1.7]$ from a SNAP-like JDEM survey
- ▶ 300 SN data with $z < 0.1$ from the NSNF.

- ▶ The fiducial model: $w_{de}(z) = -1$
- ▶ The error in distance modulus: $\sigma = 0.13$

Set z_1 as 0.4, 0.6, 0.8 and 1.0, respectively

With 2, 3, 4 and 5 times of the 2298 elementary data;
 $z_1 = 1$.

Set $\sigma = 0.13, 0.1, 0.05,$ and 0.02 , respectively; $z_1 = 1$.
Number of supernovae data: 3×2298 .

Thank You!
