Unfinished

2012Cross Strait Meeting@ChongQing, 7-12 May

# Outline

- Preamble
- CP asymmetry in D decays
- LR Mixing on  $D^0 \rightarrow (K^+ K^-, \pi^+ \pi^-)$
- Summary

# Observed CP Asymmetries

- The first event : 1964, indirect ~~CP~~ is observed in K-meson,  $\epsilon \sim 2.2 \cdot 10^{-3}$ .
- nonzero ~~D~~CP~~~~ in K-meson,  $\epsilon' / \epsilon \sim 1.7 \cdot 10^{-3}$
- indirect ~~CP~~ observed in  $B \rightarrow J/\psi K_S$ ,  $\sin 2\beta_d = 0.671 \pm 0.023$
- ~~D~~CP~~~~ in  $B \rightarrow K \pi$  was observed

$$\text{Data : } A_{\text{CP}}(B^- \rightarrow B \rightarrow \pi^+ K^-) - A_{\text{CP}}(B \rightarrow \pi^0 K^-) = -(14.8^{+1.3}_{-1.4})\%$$

# Kobayashi-Maskawa (KM) phase

- In the SM, the ~~CP~~ is arisen from the charged weak current,

$$-L_{int} = \bar{U} \gamma_\mu V_L^U V_L^{D\dagger} P_L D W^\mu$$

$$V_{CKM} \equiv V_L^U V_L^{D\dagger}$$

$$V_{CKM} V_{CKM}^\dagger = 1$$

$$\beta = \phi_1 = \arg \left( -\frac{V_{cd} V_{cb}^*}{V_{td} V_{tb}^*} \right)$$

$$\alpha = \phi_2 = \arg \left( -\frac{V_{td} V_{tb}^*}{V_{ud} V_{ub}^*} \right)$$

$$\gamma = \phi_3 = \arg \left( -\frac{V_{ud} V_{ub}^*}{V_{cd} V_{cb}^*} \right)$$

$$\alpha + \beta + \gamma = \pi$$

## With Wolfenstein's parametrization (83)

$$V_{CKM} \approx \begin{pmatrix} 1 - \frac{\lambda^2}{2} - \frac{\lambda^4}{8} & \lambda & A\lambda^3(\rho - i\eta) \\ -\lambda + \frac{A^2\lambda^5}{2}[1 - 2(\rho + 2i\eta)] & 1 - \frac{\lambda^2}{2} - \frac{\lambda^4}{8}(1 + 4A^2) & A\lambda^2 \\ A\lambda^3 \left[ 1 - \left( 1 - \frac{\lambda^2}{2} \right) (\rho + i\eta) \right] & -A\lambda^2 + \frac{A\lambda^4}{2}[1 - 2(\rho + i\eta)] & 1 - \frac{A^2\lambda^4}{2} \end{pmatrix}$$

$$A \approx 0.808, \lambda \approx 0.2253, \rho \sim 0.13, \eta \sim 0.34$$

- In the SM, the mixing induced CP asymmetry (MICPA) is large in  $B_d$  decays
- The MICPAs in  $B_s$  and D mesons are small. The good places to probe the new CP mechanism

# Why should we care the new CP phase?

- Faith, no reason to believe that there exists only one phase in nature
- KM phase can not explain the matter-antimatter asymmetry
- Motivated by current data : for instance,
  - ❖ the  $\pi K$  puzzle

Native estimation:  $A_{CP}(B^- \rightarrow \pi^0 K^-) \approx A_{CP}(B^- \rightarrow \pi^+ K^-)$

Data :  $A_{CP}(B^- \rightarrow \pi^+ K^-) - A_{CP}(B^- \rightarrow \pi^0 K^-) = -(14.8^{+1.3}_{-1.4})\%$

◆ CDF+D0: a large phase in  $B_s$  oscillation ( $B_s \rightarrow J/\psi$ )

$$V_{ts} \approx -0.041 e^{-i\beta_s}$$

$$\Delta\Gamma^s = 2|\Gamma_{12}^s| \cos\phi_s, \phi_s \approx -2\beta_s$$

$$\phi_s = [-1.17 ; -0.56]$$

$$U [-2.60 ; -2.01]$$

$$\Delta\Gamma^s = [+0.084 ; +0.224]$$

$$U [-0.230 ; -0.119] \text{ ps}^{-1}$$

- ❖ D0 observed the like-sign charge asymmetry in dimuon events, defined by

$$A_{s\ell}^b = \frac{N_b^{++} - N_b^{--}}{N_b^{++} + N_b^{--}}$$

D0 Co, PRD82(10)

$N^{++(--)}$ : The number of events that  $b$  and  $\bar{b}$ -hadron semi-leptonically decay into two positive(negative) muons

Data & SM prediction

$$A_{s\ell}^b = (-0.787 \pm 0.172 \pm 0.093) \times 10^{-3}$$

PRD84(11)

$$A_{s\ell}^b(SM) = (-0.23_{-0.06}^{+0.05}) \times 10^{-4}$$

Lenz & Nierste,  
JHEP0706(07)

# Time-dependent CPA

- Two neutral strong eigenstates  $D$ ,  $\bar{D}$ , with weak interactions the corresponding Hamiltonian is given by

$$H = \begin{pmatrix} M_{11} & M_{12} \\ M_{21} & M_{22} \end{pmatrix} - \frac{i}{2} \begin{pmatrix} \Gamma_{11} & \Gamma_{12} \\ \Gamma_{21} & \Gamma_{22} \end{pmatrix}$$

- The mass eigenstates:

$$\begin{aligned} |D_L\rangle &= p|D\rangle + q|\bar{D}\rangle \\ |D_H\rangle &= p|D\rangle - q|\bar{D}\rangle \end{aligned}$$

- The time evolution of flavor states:

$$\begin{aligned} |D(t)\rangle &= g_+(t)|D\rangle - \frac{q}{p}g_-(t)|\bar{D}\rangle \\ |\bar{D}(t)\rangle &= g_+(t)|D\rangle - \frac{p}{q}g_-(t)|\bar{D}\rangle \end{aligned}$$

- The relationship among  $p$ ,  $q$ ,  $M$ ,  $\Gamma$  in B-meson:

$$\frac{q}{p} = \left( \frac{M_{12}^* - i\Gamma_{12}^*/2}{M_{12} - i\Gamma_{12}/2} \right)^{1/2}$$

# CP Violation in D decays

- Final states are CP eigenstate
- Time-integrated CP asymmetry, defined by

$$\begin{aligned} A_{CP}(f) &= \frac{\Gamma(D^0 \rightarrow f) - \Gamma(\bar{D}^0 \rightarrow \bar{f})}{\Gamma(D^0 \rightarrow f) + \Gamma(\bar{D}^0 \rightarrow \bar{f})} \\ &= a_{CP}^{dir}(f) + \frac{\langle t \rangle}{\tau} a_{CP}^{ind} \end{aligned}$$

# The measurement of LHCb

$$\begin{aligned} A_{raw}(f) &= \frac{N(D^{*+} \rightarrow D^0(f)\pi_s^+) - N(D^{*-} \rightarrow \bar{D}^0(f)\pi_s^-)}{N(D^{*+} \rightarrow D^0(f)\pi_s^+) + N(D^{*-} \rightarrow \bar{D}^0(f)\pi_s^-)} \\ &= A_{CP}(f) + A_D(f) + A_D(\pi_s^+) + A_P(D^{*+}) \end{aligned}$$

$A_D(f)$ : detection asymmetry of  $D^0$

$A_D(\pi_s^+)$ : detection asymmetry of soft pion

$A_P(D^{*+})$ : production asymmetry for  $D^{*+}$

- $A_D(K^+K^-) = A_D(\pi^+\pi^-) = 0$

- $A_D(\pi^+_s)$  and  $A_P(D^{*+})$  are similar in KK and  $\pi\pi$ , i.e.

$$\begin{aligned}\Delta A_{CP} &= A_{\text{raw}}(K^+K^-) - A_{\text{raw}}(\pi^+\pi^-) \\ &\approx A_{CP}(K^+K^-) - A_{CP}(\pi^+\pi^-)\end{aligned}$$

- robust against systematics

□ The CP difference

$$\Delta A_{CP} = a_{CP}^{dir}(KK) - a_{CP}^{dir}(\pi\pi) + \frac{\Delta\langle t \rangle}{\tau} a_{CP}^{ind}$$

$$\frac{\Delta\langle t \rangle}{\tau} = (9.83 \pm 0.22 \pm 0.19)\%$$

$$\Delta A_{CP} \approx a_{CP}^{dir}(KK) - a_{CP}^{dir}(\pi\pi)$$

□ LHCb result: [arXiv:1112.0938](https://arxiv.org/abs/1112.0938)

$$\Delta A_{CP} = (-0.82 \pm 0.21 \pm 0.11)\%$$

$$\Delta A_{CP} = (-0.62 \pm 0.21 \pm 0.10)\% \text{ (CDF note 10784)}$$

■ CDF results: [arXiv: 1111.5023](#)

$$a_{CP}^{dir}(KK) = (-0.24 \pm 0.22 \pm 0.09)\%$$

$$a_{CP}^{dir}(\pi\pi) = (0.22 \pm 0.24 \pm 0.11)\%$$

# Naïve estimation in the SM

- Direct CP asymmetry in  $D \rightarrow (KK, \pi\pi)$

$$A_{CP}^{dir}(D^0 \rightarrow f) \sim -\text{Im} \left( \frac{V_{cb}^* V_{ub}}{V_{cq}^* V_{uq}} \right) \frac{2P_{SM}^q}{|T_{SM}^q + E_{SM}^q e^{i\delta_S^q}|^2} (T_{SM}^q \sin \phi_S^q + E_{SM}^q \sin(\delta_S^q - \phi_S^q))$$

$q=d \rightarrow \pi\pi$  mode,  $q=s \rightarrow KK$  mode

- $E_{SM}^q$  stands for the W-exchange and long-distance effects are dominated
- With  $T_{SM}^q \sim E_{SM}^q$  and  $\text{Im}(V_{cb}^* V_{ub}/V_{cq}^* V_{uq}) = \pm A^2 \lambda^4 \eta$

$$A_{CP}^{dir}(K^- K^+) \sim -A_{CP}^{dir}(\pi^- \pi^+) \sim -0.05 \frac{P_{SM}^q}{T_{SM}^q} \%$$

- Unless  $P_{SM}^q/T_{SM}^q > 1$ , the large magnitude of  $\Delta A_{CP}$  may imply the existence of new physics and new CP phase

- The detailed analysis with various approaches in the SM could be referred to

# LR Mixing in general $SU(2)_L \times SU(2)_R \times U(1)$

Chen, Geng, Wang

□ Motivation:  $a_{CP}^{ind}$  usually induced by box diagrams is still consistent with no CP violation, for avoiding the constraint, we investigate the  $\Delta A_{CP}$  is generated by tree, the same effects are suppressed at loop

□ The extension of SM based on the gauge symmetry  $SU(2)_L \times SU(2)_R \times U(1)_{B-L}$

□ Two charged gauge bosons,  $W_L, W_R,$

□ Fermion masses are from

$$\Phi = \begin{pmatrix} \phi_1^0 & \phi_1^+ \\ \phi_2^- & \phi_2^0 \end{pmatrix} = (2, 2^*, 0)$$

□ Break  $SU(2)_{L,R}$ , one can introduce doublets  $\delta_{L,R}$  and triplets  $\Delta_{L,R}$

- The mass matrix for  $W_L$ - $W_R$  is

$$M^2 = \begin{pmatrix} M_L^2 & M_{LR}^2 e^{i\alpha} \\ M_{LR}^2 e^{-i\alpha} & M_R^2 \end{pmatrix}$$

$$M_{1,2}^2 = \frac{1}{2} \left[ M_L^2 + M_R^2 \mp \sqrt{(M_R^2 - M_L^2)^2 + 4 M_{LR}^4} \right]$$

- Mass eigenstates vs gauge eigenstates

$$\begin{pmatrix} W_L^+ \\ W_R^+ \end{pmatrix} = \begin{pmatrix} \cos\xi & -\sin\xi \\ e^{i\omega} \sin\xi & e^{i\omega} \cos\xi \end{pmatrix} \begin{pmatrix} W_1^+ \\ W_2^+ \end{pmatrix}$$

$$\tan 2\xi = \frac{\mp 2M_{LR}^2}{M_R^2 - M_L^2}$$

$$m_R \gg m_L, m_{LR}, \xi \sim M_{LR}^2 / M_R^2$$

■ LR mixing effects on D decays

■ Pure  $W_R$  contributions are  $g_R^2/m_R^2$  suppressed, hereafter we don't discuss the effects.

- If  $M_R \sim 1\text{TeV}$ ,  $M_{LR} \sim 0.1\text{ TeV}$ ,  $\xi \sim O(10^{-2})$ , if no further constraint, it is large enough to enhance the CP in D decays
- In manifest or pseudo-manifest LR model,  $V^L = V^{R(*)}$ ,  $\xi < O(10^{-3})$  [Wolfenstein PRD\(84\)](#)
- The constraint could be released when flavor mixing effects are more arbitrary and carry large CP phases (nonmanifest LR model) [Langacker & Sankar PRD\(89\)](#)
- Sizable  $\xi$  and large phase in  $V^R$  could lead to large CP in Hyperon decays, [Chang, He, Pakavasa PRL\(95\)](#)
- We study the impact on the CP in  $D^0 \rightarrow \pi \pi$ , KK decays

# Decay Amplitudes

$$\mathcal{H}_{\chi\chi'}^q = \frac{4G_F}{\sqrt{2}} \frac{g_R}{g_L} \xi \left[ V_{uq}^{\chi'} V_{cq}^{\chi'*} (C'_1(\mu)(\bar{u}q)_{\chi'}(\bar{q}c)_\chi) + C'_2(\mu)(\bar{u}_\alpha q_\beta)_{\chi'}(\bar{q}_\beta c_\alpha)_\chi \right. \\ \left. + V_{uq}^\chi V_{cq}^{\chi'*} (C'_1(\mu)(\bar{u}q)_\chi(\bar{q}c)_{\chi'}) + C'_2(\mu)(\bar{u}_\alpha q_\beta)_\chi(\bar{q}_\beta c_\alpha)_{\chi'} \right].$$

Here,  $\chi = L(R)$  and  $\chi' = R(L)$  while  $q = s(d)$ , and  $(\bar{q}q')_{L(R)} = \bar{q}\gamma^\mu P_{L(R)}q'$ . The Wilson coefficients  $C'_1 = \eta_+$  and  $C'_2 = (\eta_+ - \eta_-)/3$  with QCD corrections could be estimated by [25, 26]

$$\eta_+ = \left( \frac{\alpha_s(\mu)}{\alpha_s(m_c)} \right)^{-3/27} \left( \frac{\alpha_s(\mu)}{\alpha_s(m_b)} \right)^{-3/25} \left( \frac{\alpha(m_b)}{\alpha_s(m_W)} \right)^{-3/23}, \\ \eta_- = \eta_+^{-8}. \quad (14)$$

Based on the decay constants and transition form factors, defined by

$$\begin{aligned}\langle 0 | \bar{q}' \gamma^\mu \gamma_5 q | P(p) \rangle &= i f_P p^\mu, \\ \langle P(p_2) | \bar{q} \gamma_\mu c | D(p_1) \rangle &= F_+^{DP}(k^2) \left\{ Q_\mu - \frac{Q \cdot k}{k^2} k_\mu \right\} \\ &\quad + \frac{Q \cdot k}{k^2} F_0^{DP}(k^2) k_\mu,\end{aligned}$$

$$A_{LR}^q(D^0 \rightarrow f) = (V_{cq}^{L*} \bar{V}_{uq}^R - \bar{V}_{cq}^{R*} V_{uq}^L) T_{\chi\chi'}^q$$

$$T_{RL}^d = \frac{G_F g_R}{\sqrt{2} g_L} \xi a'_1 f_\pi F_0^{D\pi} (m_D^2 - m_\pi^2),$$

$$T_{LR}^s = \frac{f_K}{f_\pi} \frac{F_0^{DK}}{F_0^{D\pi}} \frac{m_D^2 - m_K^2}{m_D^2 - m_\pi^2} T_{RL}^d,$$

$$a'_1 = C'_1 + C'_2/N_c.$$

- CP asymmetries :

$$A_{CP}(D^0 \rightarrow f) \equiv \frac{\Gamma(D^0 \rightarrow f) - \Gamma(\bar{D}^0 \rightarrow f)}{\Gamma(D^0 \rightarrow f) + \Gamma(\bar{D}^0 \rightarrow f)}$$

- With  $V_{ud}^L = -V_{us}^L \sim \lambda$

$$|A^d|^2 - |\bar{A}^d|^2 = -4E_{SM}^d T_{RL}^d \sin \delta_S^d (\lambda^2 \text{Im} \bar{V}_{ud}^{R*} + \lambda \text{Im} \bar{V}_{cd}^R) ,$$

$$|A^s|^2 - |\bar{A}^s|^2 = -4E_{SM}^s T_{LR}^s \sin \delta_S^s (\lambda \text{Im} \bar{V}_{us}^{R*} - \lambda^2 \text{Im} \bar{V}_{cs}^R) .$$

$$\bar{V}^R = e^{i\omega} V^R$$

- The CPAs depend on the pattern of  $V^R$

# Constraint from $\epsilon' / \epsilon$

- The tree induced CP also contributes to direct CP violation in  $K \rightarrow \pi \pi$

$$(\epsilon'/\epsilon)_K \sim 1.25 \times 10^{-3} g_R/g_L \xi \text{Im}(\bar{V}_{us}^R - \lambda \bar{V}_{ud}^{R*}).$$

He, McKellar, Pakvasa, PRL(88)

- To avoid the constraint from DCPV in K decays, we consider two cases:

- $\text{Im}(\bar{V}_{us,ud}^R) \approx 0$

- $\text{Im} \bar{V}_{us}^R \approx \lambda \text{Im} \bar{V}_{ud}^{R*}$

□ The SM inputs : [arXiv:1201.0785](https://arxiv.org/abs/1201.0785), Cheng & Chiang

TABLE I. Numerical inputs for the parameters in the SM.

$T_{SM}^d$	$T_{SM}^s$	$E_{SM}^d$	$E_{SM}^s$	$\delta_S^d$	$\delta_S^s$
$3.0 \times 10^{-6} \text{GeV}$	$4.0 \times 10^{-6} \text{GeV}$	$1.3 \times 10^{-6} \text{GeV}$	$1.6 \times 10^{-6} \text{GeV}$	$145^\circ$	$108^\circ$
$V_{us}^L$	$m_{\pi(K)}$	$m_D$	$f_{\pi(K)}$	$F_0^{D\pi(K)}$	$m_t$
0.22	0.139(0.497)GeV	1.863GeV	0.13(0.16)GeV	0.666(0.739)	162.8 GeV

□ The BRs for  $D \rightarrow (KK, \pi\pi)$  in the SM are

$$\mathcal{B}(D^0 \rightarrow K^- K^+) = 4.0[3.94 \pm 0.07] \times 10^{-3}$$

$$\mathcal{B}(D^0 \rightarrow \pi^- \pi^+) = 1.4[1.397 \pm 0.026] \times 10^{-3}$$

# Results: Case I $Im(\bar{V}_{us,ud}^R) \approx 0$

$$\begin{aligned}\bar{V}_{cd}^R &= -\lambda \bar{V}_{cs}^R \\ &= -\lambda e^{i\theta}\end{aligned}$$

$$\begin{aligned}A_{CP}(K^+K^-) &\approx \\ &-A_{CP}(\pi^+\pi^-)\end{aligned}$$

$$\xi \rightarrow g_R/g_L \xi$$

# Case II: $Im \bar{V}_{us}^R \approx \lambda Im \bar{V}_{ud}^{R*}$

□ We get

$$|A^d|^2 - |\bar{A}^d|^2 = -4E_{SM}^d T_{RL}^d \sin \delta_S^d (\lambda^2 Im \bar{V}_{ud}^{R*} + \lambda Im \bar{V}_{cd}^R)$$

$$|A^s|^2 - |\bar{A}^s|^2 = 4\lambda^2 E_{SM}^s T_{LR}^s \sin \delta_S^s (Im \bar{V}_{ud}^{R*} + Im \bar{V}_{cs}^R)$$

□ We adopt the patterns for the numerical analysis

$$V_A^R(\alpha) = \begin{pmatrix} 1 & 0 & 0 \\ 0 & c_\alpha & \pm s_\alpha \\ 0 & s_\alpha & \mp c_\alpha \end{pmatrix}, \quad V_B^R(\alpha) = \begin{pmatrix} 0 & 1 & 0 \\ c_\alpha & 0 & \pm s_\alpha \\ s_\alpha & 0 & \mp c_\alpha \end{pmatrix}$$

we adopt  $\alpha = 0$  for the numerical analysis

Langacker & Sankar PRD(89)

# $V_A^R(\alpha=0)$

- $V_{cd}^R \rightarrow 0$  and  $\text{Im}(V_{ud}^R) \approx 0$  due to  $\varepsilon' / \varepsilon$ . As a result, CPA in  $D^0 \rightarrow \pi\pi \rightarrow 0$

$$V_B^R(\alpha=0)$$

□  $V_{ud,cs}^R \rightarrow 0, A_{CP}(D^0 \rightarrow KK) \rightarrow 0$

# Summary

- LHCb and CDF show the direct CP violation in D decays with  $3.8\sigma$  deviation from the no CP violation. The “anomaly” could be explained by the LR mixing in the general LR model
- The same effects could predict large CPA in doubly Cabibbo suppressed process, such as  $D^0 \rightarrow \pi^- K^+$  decays
